[Abstract]　Objective：To construct the Rv2647-deleted strain and Rv2647-complemented strain of *Mycobacterium tuberculosis*(*M. tb*)and Rv2647-overexpressing *Mycobacterium smegmatis*(Ms∷Rv2647)by phage recombination technique，and to evaluate the effect of

M. tb Rv2647 protein on lung injury in model mice. **Methods:** A homologous exchange site was constructed and integrated into the phage genomes of *M. tb*, producing phagemids that were introduced into *Mycobacterium smegmatis*(Ms)to create a recombinant phage with a homologous exchange site. High-titer recombinant phages were amplified *in vitro* and transfected into *M. tb*(H37Rv), followed by static culture at 37 ℃ for 28 d. The single clone was selected and verified by PCR, yeilding the Rv2647 - deleted strain (H37RvΔRv2647). The Rv2647 gene was amplified by PCR and was integrated into the multiple clone sites of vector pMV361 and pMV261 through seamless cloning to obtain the positive plasmids, which were transfected into H37RvΔRv2647 and Ms to obtain the Rv2647 - complemented strain(H37RvΔRv2647::Rv2647)and Rv2647 - overexpressing Ms(Ms::Rv2647), respectively. The suspension of H37Rv, H37RvΔRv2647, H37RvΔRv2647::Rv2647, Ms, and Ms::Rv2647 were used to infect C57BL/6 mice via tracheal injection. The survival rates, lung tissue bacterial load, and pathological damage of lung tissue in model mice were compared at 7 d and 30 d, respectively. **Results:** The PCR showed that Rv2647 gene was missing in the H37RvΔRv2647, while it was present in the H37RvΔRv2647::Rv2647 and Ms::Rv2647. The 30-day survival rates of model mice infected with H37RvΔRv2647, H37Rv, and H37RvΔRv2647::Rv2647 were 100.00%, 83.33%, and 83.33%, respectively; The 7-day survival rates of model mice infected with Ms and Ms::Rv2647 were 100.00% and 83.33%, respectively. The lung bacterial load(lgCFU)of model mice in the H37RvΔRv2647 group(3.40±0.18)was significantly lower than that of the H37Rv group(3.86±0.15), $P < 0.001$)and the H37RvΔRv2647::Rv2647 group(3.80±0.16), $P < 0.01$); The inflammation area(%)in lung tissues of the H37RvΔRv2647 group(4.37±3.06)was significantly lower than that of the H37Rv group(62.76±14.24), $P < 0.001$)and the H37RvΔRv2647::Rv2647 group(67.37±0.45), $P < 0.001$). The lung bacterial load(lgCFU)of the Ms group(2.53±0.16)was significantly lower than that of the Ms::Rv2647 group(2.81±0.13), $P < 0.01$); The inflammation area(%)in lung tissue of the Ms group(5.71±1.29)was significantly lower than that of the Ms::Rv2647 group(33.13±13.84), $P < 0.05$). **Conclusion:** The Rv2647 - deleted strain(H37RvΔRv2647)and Rv2647 - complementary strain (H37RvΔRv2647::Rv2647)of *M. tb* and Rv2647-overexpressing Ms(Ms::Rv2647)were successfully constructed. Rv2647 protein may aggravate lung injury *via* inhibiting host clearance of *M. tb*.

结核病是结核分枝杆菌(*Mycobacterium tuberculosis*, *M. tb*)导致的严重传染性疾病,目前仍在全球范围内广泛流行。在感染宿主的过程中,*M. tb*可通过进化方式逃避宿主免疫反应使之长期存活[1]。卡介苗(bacillus calmette-guerin，BCG)是目前唯一可用的*M. tb*疫苗,对儿童播散性结核病可发挥有效预防作用,但对成人的长期保护效应有限[2]。比较基因组学研究发现,与野生株相比,BCG丢失了100多个基因编码序列,即所谓差异区域(regions of difference，RD),其包含了16个区域(RD1-RD16)[3]。研究表明,RD可通过编码潜在效应蛋白在结核病发病过程中发挥重要作用[4-5]。有关RD13区Rv2647基因编码蛋白对宿主的致病性研究既往未见报道。本研究运用噬菌体介导的基因重组技术分别构建了H37Rv的Rv2647基因敲除株(H37RvΔRv2647)和回补株(H37RvΔRv2647::Rv2647);Ms被广泛用于表达分枝杆菌蛋白,是研究*M. tb*致病机制的良好模型[6]。Rv2647基因在Ms中缺失,本研究也构建了过表达Rv2647的Ms(Ms::Rv2647);通过构建*M. tb*和Ms攻击模型评估Rv2647蛋白对模型鼠的肺组织损伤效应,为深入研究该蛋白在*M. tb*对宿主致病性中的作用奠定基础。

3　讨　论

　　结核病是除新冠肺炎外全球第一大因单一病原感染导致的致死性传染病[11]。目前，BCG的预防效果不佳，且多耐药菌株及泛耐药菌株的流行进一步加剧了结核病的防治形势。因此，迫切需要深入研究 $M. tb$ 的关键致病机制以开发新型疫苗与药物。大量研究表明，$M. tb$ 的RD区含有众多毒力因子及特异性抗原，在结核病的发生发展中发挥重要作用[12-16]。

　　Rv2647基因位于RD13区，该区域共包含16个阅读框（Rv2645-Rv2660c）。研究显示，该区Rv2645基因编码的假想蛋白，可诱导强烈的抗 $M. tb$ 特异性IFN-γ应答，与BCG联合可显著增强免疫保护效应[17]；另有研究发现，Rv2654c和Rv2659c分别编码噬菌体蛋白和噬菌体整合酶，可诱导结核病特异性的T细胞应答，显著提高结核病诊断的特异性和敏感性[18-19]；此外，Rv2660c编码的相关蛋白，在 $M. tb$ 潜伏感染状态下表达显著上调，可通过TLR2介导TNF-α、IFN-γ等炎症因子的分泌，利于 $M. tb$ 潜伏感染[20]。Rv2647基因编码蛋白在 $M. tb$ 感染及致病中的作用尚不清楚。

　　基因编辑技术是研究 $M. tb$ 基因功能的有效手段。目前，应用于 $M. tb$ 的基因敲除技术主要有依赖于同源重组的基因敲除技术和不依赖于同源重组的基因沉默技术。其中，噬菌体介导的同源重组技术可显著提高转染效率及同源重组效率而被广泛应用。本研究采用具有高DNA传递效率的含温敏

型 噬 菌 体 元 件 的 穿 梭 质 粒 phAE159,构 建 了 phAE159‐ΔRv2647噬菌粒,在 Ms 内扩增后导入 H37Rv,获 得 H37RvΔRv2647,并 进 一 步 构 建 H37RvΔRv2647::Rv2647和 Ms::Rv2647,为深入研究 Rv2647基因的功能奠定了基础。

本 研 究 中 分 别 以 H37Rv、H37RvΔRv2647、H37RvΔRv2647::Rv2647、Ms 及 Ms::Rv2647经气管攻击C57BL/6小鼠,H37RvΔRv2647组模型鼠30 d生存率高于 H37Rv 组和 H37RvΔRv2647::Rv2647组;Ms组模型鼠7 d生存率也高于 Ms::Rv2647组;H37RvΔRv2647组模型鼠的肺组织细菌负荷和肺组织病理损伤程度均显著低于 H37Rv 组和 H37RvΔRv2647::Rv2647组;同样地,Ms 组模型鼠的肺组织细菌负荷和肺组织病理损伤程度亦显著低于 Ms::Rv2647组。本研究提示,Rv2647蛋白在 *M. tb* 感染的致病过程中可能通过削弱模型鼠对 *M. tb* 的清除效应而加重了肺组织的病理损伤,其具体致病机制值得进一步探究。

本研究成功构建了 *M. tb* 的 Rv2647基因敲除株(H37RvΔRv2647)和 回 补 株(H37RvΔRv2647::Rv2647)以及过表达 Rv2647的 Ms(Ms::Rv2647);初步探明了 Rv2647蛋白可能通过抑制模型鼠对 *M. tb* 的清除,加重肺组织病理损伤。
